

HardDiskTemp

Installation guide

Requirements

Installation requirements: Windows 10/11 64-bit, administrator rights for installation and access to the smartctl included in the package. A separate .NET SDK is not required for normal installation/use of the installer; SDK is needed only for build/compile from source or builder. After installation, the application works from the tray and displays temperature only when the disk provides a reliable reading.

Windows Applications / Windows components: HardDiskTemp does not require Microsoft Store installation or a separate Windows App SDK for normal use. It uses the components installed with the package and the embedded smartctl; additional Windows components are installed only if the system clearly requires them.

No extra runtime, SDK, WPT, compiler, or internet download is required. Note: If the setup does not start on a damaged Windows installation, repair Windows/.NET Framework using Microsoft tools and run the setup again.

Download Instructions

1. Download the latest HardDiskTemp installer.
2. Right-click → Run as administrator.
3. Starts with Windows and appears in the notification area.
4. Verify the SHA256 when needed.
5. If the temperature icon does not appear in the tray, restart your computer and select HardDiskTemp in Windows Settings → Personalization → Taskbar → Other taskbar icons.

Verify the download

After downloading, compare the SHA256 shown here with the downloaded installer hash.
